1. **Identify the main components of the system.** The system consists of a **client** and a **server**. The client is responsible for sending requests to the server, and the server is responsible for processing these requests and returning responses.

2. **Describe the data flow.** Data flows from the client to the server via a **network**. The client sends a request, and the server returns a response.

3. **Explain the communication protocol.** The communication protocol is based on **HTTP** (Hypertext Transfer Protocol). The client sends an **HTTP request** to the server, and the server returns an **HTTP response**.

4. **Detail the error handling.** The system includes error handling mechanisms to manage unexpected situations. For example, if the client receives a **404 Not Found** response, it indicates that the requested resource does not exist.

5. **Summarize the overall architecture.** The overall architecture is a **client-server** model. The client initiates the communication, and the server processes the requests and returns the results.
